

Operation Obliteration Series — Press Kit

[OP OBLIT HOME](#)

Genre: First-Person Shooter (FPS)

Platform: Windows PC

Engine: Legacy engines and Unity

Developer: Oblit Gamewerks Inc.

Promotional graphics download: [zip.zip](#)

The Operation Obliteration series is a three-part FPS project built on Unity-based framework and earlier legacy engines. It combines classic shooter design with modern modular systems and technical architecture.

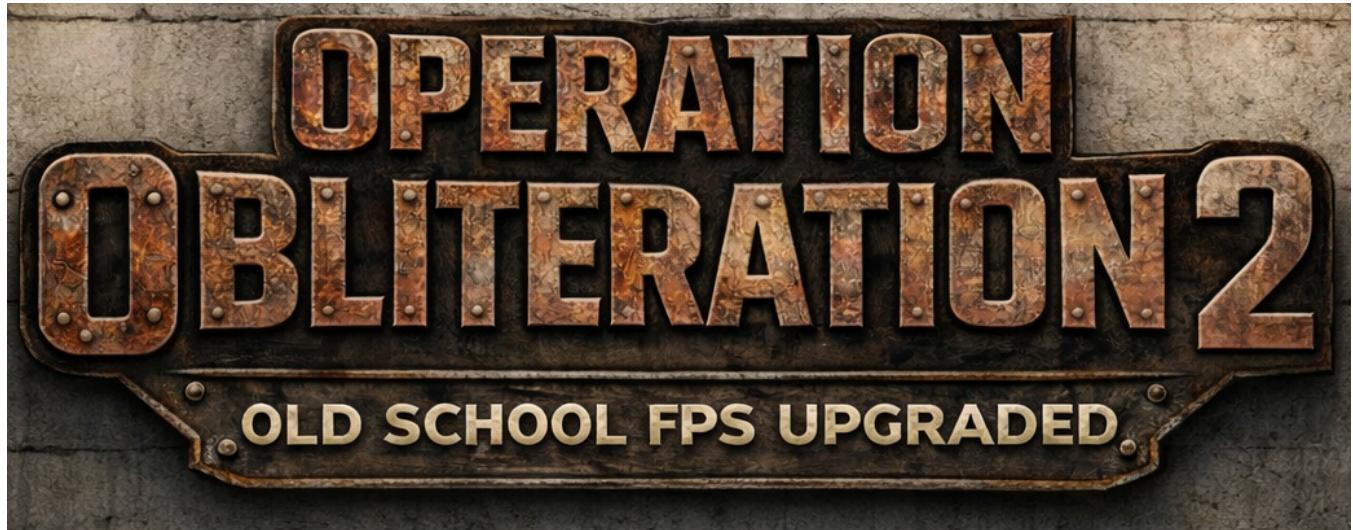

Operation Obliteration I

Role in Series: Core framework foundation.

Overview

The first title establishes the baseline FPS architecture, including weapon systems, enemy logic, HUD design, and level flow. It focuses on classic shooter mechanics, clear feedback, and deterministic combat behavior. It is built on a legacy engine.

Operation Obliteration II

Role in Series: System expansion.

Overview

The second title expands the core framework with advanced event-driven level design, layered enemy escalation, environmental hazards, and refined combat feedback systems. It emphasizes systemic complexity while preserving clarity and fairness in gameplay. Built on a custom modified legacy engine.

Operation Obliteration III

Role in Series: Technical culmination built on a modern Unity-based FPS framework.

Technical Focus

Operation Obliteration III is being developed in Unity using a modular architecture designed for performance, scalability, and clear separation of gameplay systems.

- Modular gameplay systems for combat, AI, HUD, events, and player mechanics
- AI encounters controlled by triggers, timers, and zone-based logic
- Scripted event chains optimized for real-time gameplay
- Medical injector system where timed pharmacological effects modify player attributes and generate systemic side effects
- Optimized HUD and feedback pipeline for fast, readable combat information

Design Goal

To deliver a modern Unity-based FPS in which level design, AI behavior, player physiology, and feedback systems operate as a single coherent framework rather than isolated features. Duplicating the raw, chaotic action of legacy software, using the modern Unity engine.

Core Design Philosophy (Series-Level)

The Operation Obliteration series treats FPS development as a systems-engineering problem rather than a cinematic experience. The focus is on mechanical transparency, deterministic behavior, and player comprehension under pressure. We despise cut scenes and any other design feature that stops the player from the action and design our games accordingly.

About the Developer

Oblit Gamewerks Inc. is an independent game development studio focused on system-driven shooter design and modular gameplay architecture inspired by classic FPS principles. We specialize in Old school shooters/boomers(FPS) with a WW2 theme.
